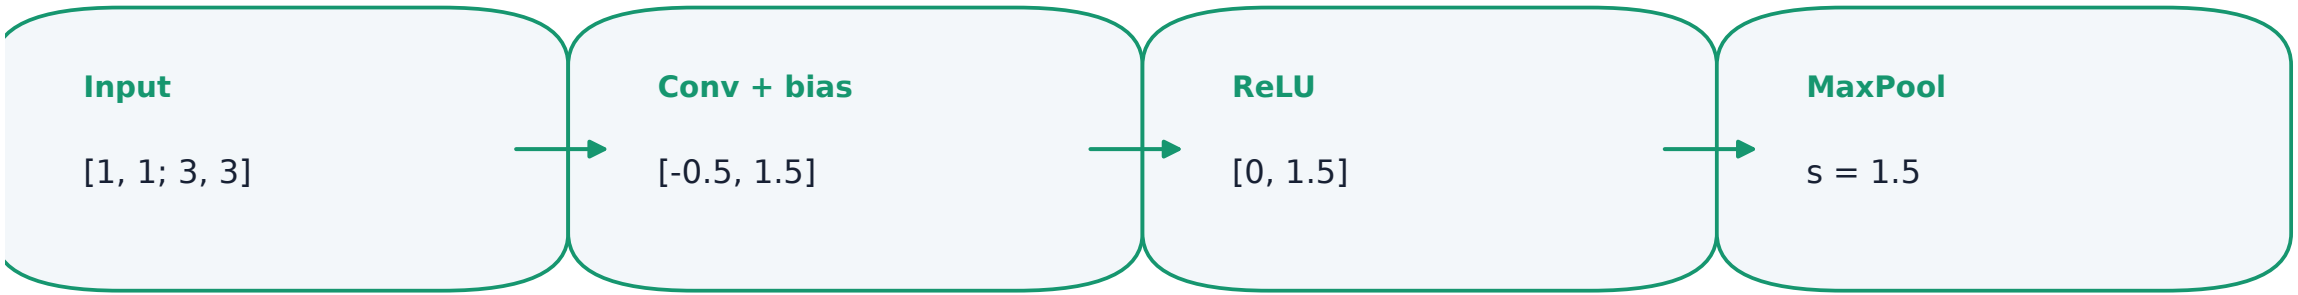
CNN endpoint rule: current gates and the winning route

A compact analytic example isolates exactly what the original rule propagates



Endpoint map · Σ = 3.0

0.00	0.00
1.50	1.50

Path IG · Σ = 1.5

0.00	0.00
0.75	0.75

$$s(\alpha x) = \max(3\alpha - 1.5, 0)$$

Endpoint uses the open gate at x.

Path IG is zero before α = 0.5.
