The target definition changes the learning image

A unit, a channel sum, and activation-weighted energy are three different scalar questions

Single unit

$$s = h_2$$

Endpoint map

0.00	0.00
1.50	1.50

Channel sum

$$s = h_1 + h_2$$

Endpoint map

0.50	0.50
1.50	1.50

Feature-map energy

$$s = \frac{1}{2}\sum_t h_t^2$$

Endpoint map

0.50	0.50
4.50	4.50

Target IDs must be fixed before looking at maps; otherwise the scientific question changes with the picture.
