ViT local operators need their real Jacobians

LayerNorm couples channels; GELU is a continuous multiplier, not a binary gate

LayerNorm

$$\frac{\partial y_i}{\partial u_j} = \frac{\gamma_i}{\sigma}[\delta_{ij} - \frac{1}{D} - \frac{\hat{u}_i \hat{u}_j}{D}]$$

Mean and variance couple every input channel.
Freezing them changes the map.

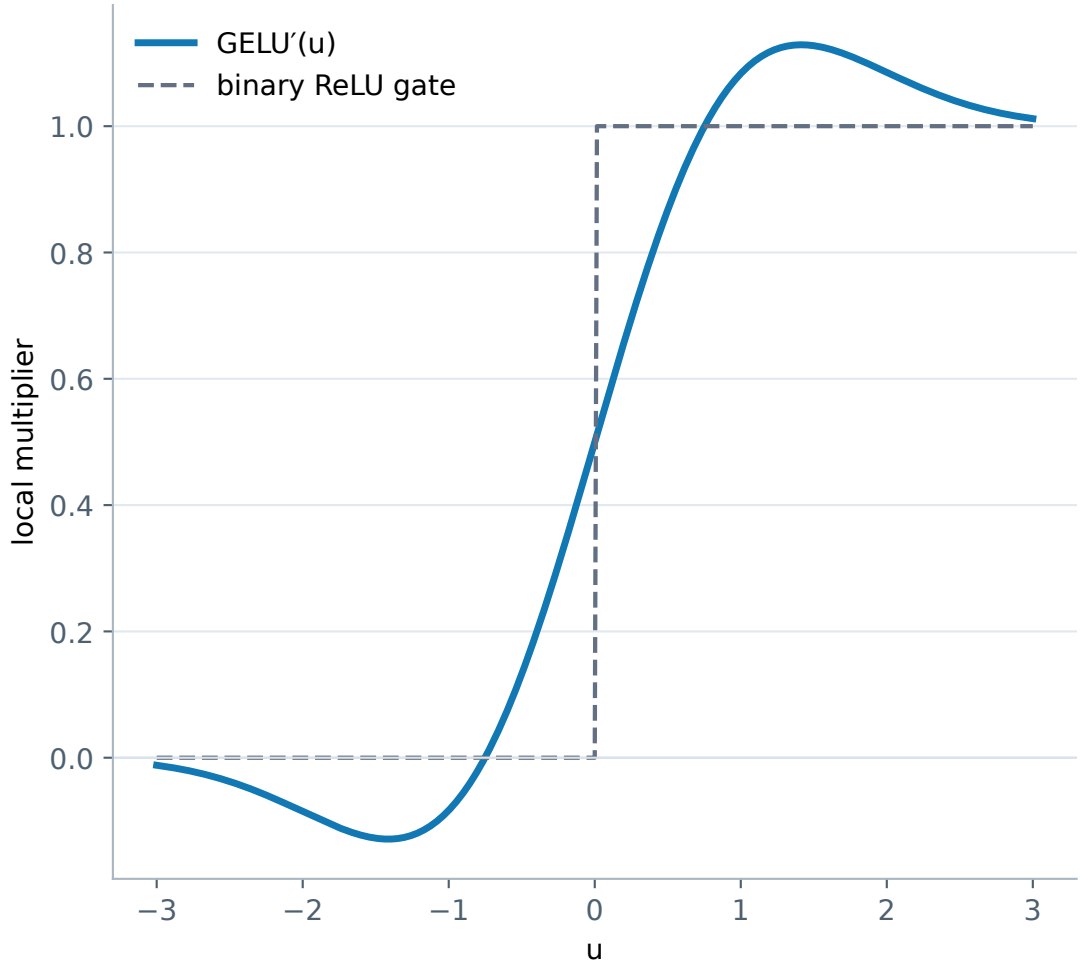
0.00	-0.00

$$GELU'(u) = \Phi(u) + u\phi(u)$$



These are analytic operator contracts, not new trained-model measurements.
