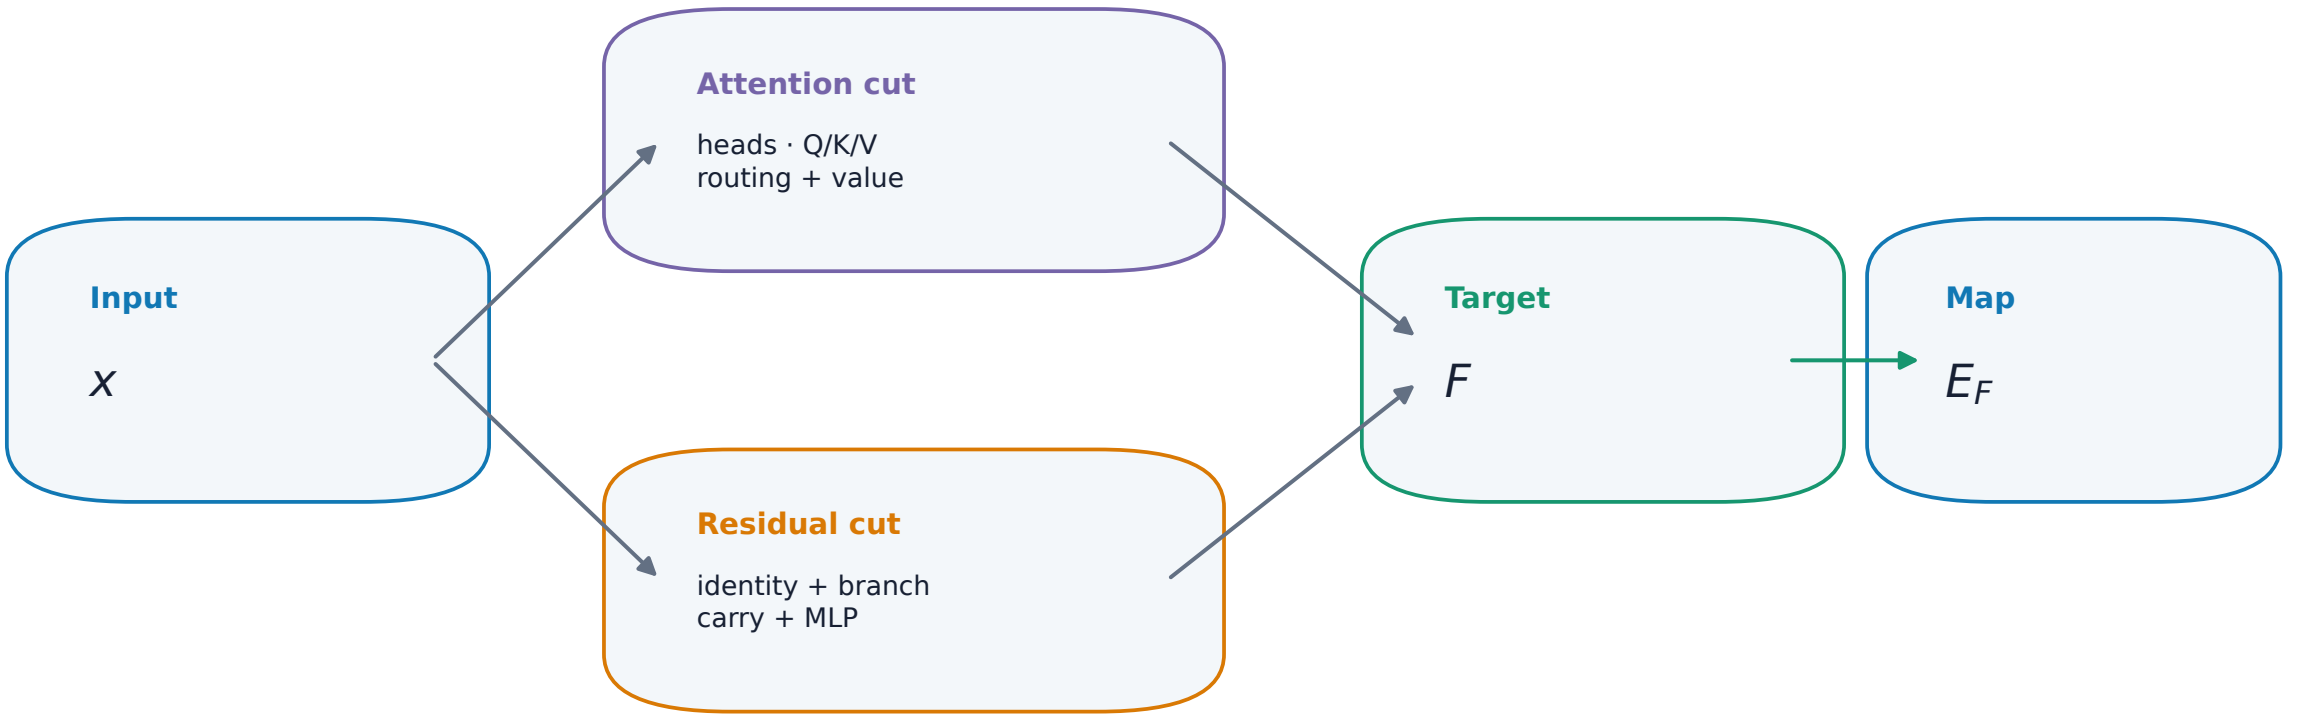
Structured cuts answer: which internal route carried the endpoint response?

Each registered cut reconstructs one named total; cuts are not added across definitions



$$E^C_{k,i} = x_i \langle \nabla_{z_k} F, \partial_i z_k \rangle, \qquad \sum_k E^C_{k,i} = x_i \partial_i F$$

Omission and duplication controls must fail; otherwise the cut is not structurally identified.
